Developed and marketed under the brand name AutoCAD, AutoCAD was first released in December 1982 as a desktop app running on microcomputers with internal graphics controllers. Before AutoCAD was introduced, most commercial CAD programs ran on mainframe computers or minicomputers, with each CAD operator (user) working at a separate graphics terminal. AutoCAD is also available as mobile and web apps. AutoCAD is available for use with various computer hardware and operating systems, including Apple, Windows, Linux, and macOS. AutoCAD is designed to work on a single computer, but it can be networked for multiple users on a single computer. Contents AutoCAD is based on the principle of Command Line, it can be used to create 2D or 3D drawings. Most new users start off using AutoCAD with basic commands and a vector tablet and learn the advanced features later. The program includes a feature called "Quick Access" to allow users to work on a 2D drawing without losing context. This is useful for quick editing of a drawing, for example, when placing an object on a drawing, simply click and drag it onto the drawing without any loss of original dimensions. Some of the key features of AutoCAD are: Drafting Creating and editing 2D drawings Drawing over existing drawings Part drawing Multi-user support Cloud support Data exchange (XML, DWG, DWF, DXF, IGES, ISO) Drafting Drawing 2D drawings with AutoCAD includes drawing basic geometric shapes, with different types of geometric shapes, drawing details (like hatchings), drawing edges, and 3D parts and 3D models. Creating and editing 2D drawings AutoCAD is a desktop application, and it includes many commands for creating and editing 2D drawings. These include: Layout AutoCAD can layout drawings for printing, presentation, or export to other formats. You can quickly copy the layout of

AutoCAD Electrical, a suite of tools for electrical engineering. It is the main software used by electrical engineers. AutoCAD Map 3D, a geographic information system that is part of Autodesk Map 3D. It is used to create, edit, display, and analyze geographic data in the form of map information. Autodesk® Revit® Architecture, Autodesk's software package for architectural design, modeling, and engineering. Autodesk® Revit® Structure, a part of Autodesk Revit Architecture. Autodesk® Revit® Contract, a parts of Autodesk Revit Architecture. AutoCAD LT, a licensed software component of Autodesk AutoCAD. It is a free desktop-based version of AutoCAD that is distributed by AutoDesk. AutoCAD Map 3D, a geographic information system (GIS) that is part of Autodesk Map 3D. AutoCAD Map Design, a part of Autodesk Map 3D. AutoCAD R14, a software license for the use of Autodesk products, with an annual fee. Versions The first version was released on April 29, 1982 as AutoCAD for MS-DOS. The early versions of AutoCAD could not run on an 8088 processor and could not interpret certain commands, such as C or C++ source code, embedded in a drawing. The name "AutoCAD" was also changed in 1983 to "AutoCAD Workbench". In October 1985, the first version of AutoCAD for Macintosh and Mac OS was released. The first version of AutoCAD on the OS/2 operating system was released in 1990. Operating systems AutoCAD is available on the Windows, Macintosh and UNIX operating systems. References Category:Windows-only softwareI'm working on an A/B testing site with a very general purpose framework, and I'm struggling with a situation where I need a secondary page to be loaded in the user's browser if the content of the primary page is invalid. Because this is a meta level of functionality, I don't want to load any of the content on the secondary page until the content on the primary page is valid. My first thought is to just check the response from the primary page (e.g. the existence of a resource), and redirect the user to the secondary page in that case. However, this sounds terrible because it's a very crude way of handling the problem, and I think it will break my A/B testing framework. One approach I've been considering is using a timer to check whether the content on the primary page is valid. If it is, we can start loading the secondary page. If not, we just hang out for a bit. Is there a more elegant solution? Is there any way to get the user to wait until a resource that the user requests on the primary page is ready? Update: A different approach I was considering was to set up a temporary page (e.g. /temporary/), which I will redirect the user to. This page will be loaded into the user's browser, with a hidden iframe that I will check for the existence
