What's New In?

Virtual Metronome is a simple and easy-to-use metronome, timer, and stopwatch. Virtual Metronome has a regular beat that is adjustable by the user and supports MIDI output. You can set the metronome rate and choose to play a song or stop a song you've already started. You can even automate the metronome's beat by recording each successive click in a text file. Use Virtual Metronome to get in a good groove, help with practice sessions, and just plain get motivated to do your best! You'll be clapping, tapping your foot, and playing with a new purpose. Reduced the number of files needed to create a MIDI sequence, reducing the size of the installation file. Added the ability to delete MIDI sequences. Reduced the size of the metronome popup. Improved the cellist stop click detection when the cellist moves to the right. Reduced memory usage in the cellist stop click detection when it's stopped. Reduced metronome delay when jumping to a new cellist. When metronome rate is set to 'stop', the 'can't play until the next beat is detected' dialog doesn't appear anymore. Moved the cellist stop click detection from the cellist context menu to the cellist control panel. The stop and start button support now works

when the application is minimized. Metronome no longer resets the number of beats when the metronome is started in the background and then restarted. The cellist stop now works on the toolbar and there are no more mouse clicks when clicking on the cellist.

Changed the cellist stop click detection behavior to be consistent across all the metronome's cellists. When the cellist stop click detection is used with the toolbar, the volume level is changed to the previous volume before the click was detected. When the cellist stop click detection is used with the cellist control panel, the volume level is not changed. Video Tutorials of Virtual Metronome Main features of Virtual Metronome:
