The free Adobe Photoshop Elements is intended for beginners and offers many of the basics that professional users need. You can get it at `www.adobe.com/products/photoshop_elements`. The other popular image-editing program is GIMP (GNU Image Manipulation Program). GIMP is a free alternative to Photoshop and is available at `www.gimp.org`. Although some features available in Photoshop aren't available in GIMP, GIMP is easier for beginners to use and has more features. Like Photoshop, GIMP uses a layer-based, raster-image-editing system. It also offers vector graphics, called paths, which are line drawings that can be drawn or edited and used in place of bitmapped images. Photoshop and GIMP offer both layered and pixel-based editing and are generally compatible with each other. Because they have such a wide range of functions, you don't necessarily need Photoshop or GIMP to be able to edit an image — some other image-editing program does just as good a job. But a high-end image-editing program is the best way to create professional-quality images. You can find other programs in the free and trial categories at `www.win.tue.nl/~jeroen/web/free-software/gimp/faq.html`. Photoshop Elements is easier to use and isn't as full-featured as the full version of Photoshop, so if you just want to draw a line or crop and edit an image, you're better off using Photoshop Elements. However, Photoshop Elements is also cheaper, so if you're an advanced user, you may want to get Photoshop instead. Aperture Aperture is a more expensive program than Photoshop but is faster to use, offers more features, and includes the ability to use a lot of other MacOS applications for image manipulation. Mac users can use Aperture Lite, which is a slightly earlier version of the program, or go all the way to Aperture. The latest version is called Aperture 3, which I cover in the next section. Apple's Pros and Expert Editions of Aperture are also available for purchase, as is Photoshop Elements, which is a cheaper program, but it doesn't include the features found in the Aperture and Photoshop versions. Adobe Photoshop Elements 7 is also available for Mac OS X, but it's

Expression of the urokinase receptor in the quail corneal endothelium. This study aims at demonstrating that corneal endothelium expresses the urokinase receptor (u-PAR) and to evaluate its role in cell adhesion to the vitreal surface of the cornea. Freshly isolated duck, chicken, and rabbit corneas were examined by immunohistochemistry and Western blotting with antibodies to the u-PAR. Endothelium from freshly obtained corneas (two eyes from a new-born and one eye from an adult) was examined by electron microscopy with anti-u-PAR antibodies on ultrathin cryosections. After antigen retrieval and blocking, rabbit corneal endothelium was incubated with rat u-PAR-specific antibodies. The chick corneal endothelium was cultured on rat osteosarcoma cells (U937-ATCC) prelabeled with the fluorescent dye PKH-26. Endothelial cells from the duck, chicken, and rabbit cornea express u-PAR in their cell surface and cytoplasm. We found no difference between the density of the u-PAR on endothelium from the superficial and deep stroma. Electron microscopy showed that the u-PAR is localized at intercellular contact sites. Rabbit corneal endothelium cultured on rat u-PAR-transfected U937-ATCC cells adheres preferentially to rabbit u-PAR-transfected U937-ATCC cells, but not to untransfected U937 cells. Our findings suggest that corneal endothelium expresses the u-PAR and that its presence may contribute to cell adhesion in the cornea.Q: jquery checkBox check/uncheck when the page is loaded I have a checkbox, and when I click it an alert will be displayed.
