Select and add you path and add the following to the java compiler. -XX:+Cacblock -XX:UseKeytool=0 -XX:+UseJVMCICompiler This disables the jvme and uses the keytool to sign the JEDI JDK. Also, you should install it to a location that your systems java uses. I've tried it on windows, linux and mac. For mac, the process is similar but this is required. Download the keytool from Oracle. It's not a very good idea to use a solution like this, because it will be applied to the entire library. But if you need to improve the performance and use this technique you may do it. But it is not recommended because this is not a good idea. In my experience the best solution is to re-arrange the tags according to data. That is, it does not make sense to have the Date tag next to the Subject tag. It should be the other way around. This is how it is done in the example that I have seen and it is called YD (Yes/No/Date). The other tags are numeric values. Most data tagging is performed using the Boolean operators OR and NOT (see so for each data field you have a Y or N in the field, so you can use Boolean math to make all the number parts, like, say, Then when the user asks for the documents that were returned in the last year, then you would have the not of the last year, which is NOT the last year, and you would sum the yes of the last year. That way you would know how many documents were returned in the last year. And then you can say,
