Wondershare Data Recovery is a data recovery software in the market. Q: What's the resolution of a Release build? I know the basic idea of Release build is to generate a binary with highest possible performance for your device. Thus, it is generated with optimization flags set to their fullest. But I have a problem with that: Which resolution, pixel density and what else is used to build Release? For example in this image, I have an iPhone 7, and know that its screen is @3125x2436px. But how does iOS decide to take it into the picture? A: The reason that an iOS app can have different pixel densities depending on the device's model is that pixel density is determined by the aspect ratio. It can be one of two values: 1.0, which means that it is the same as the pixel ratio of the main display screen (not a.k.a. iPhone X). This is the value of the "pixel ratio" property on the Capabilities key. Screenshot of a device with a 1.0 pixel ratio at 1440x3168px And the "pixel ratio" property only takes effect when no Retina scaling is used. (see pixel ratio below) Some devices have a 2.0 pixel ratio, which means that it's twice the pixel ratio of the main display screen. This is the value of the "pixel density" property on the Capabilities key. Some devices have a 3.0 pixel ratio, which means that it's three times the pixel ratio of the main display screen. This is the value of the "pixel density" property on the Capabilities key. (see pixel ratio below) And the "pixel ratio" property only takes effect when no Retina scaling is used. edd6d56e20
