Developed using C# and VB.NET, the.NET PDF API allows developers to create PDF documents from within their.NET applications. The PDF API integrates with different applications for its operations, among them are Microsoft Word, Outlook and other widely available office tools. The library has several options for working with PDF documents. They include reading, writing, modifying and creating new PDF files. What's more, the API provides a way for keeping track of changes and making them available for audit purposes. The library comes with two executables: SelectPdfLibrary.exe: This application is a stand-alone PDF creation utility. It is capable of opening PDF files and creating new PDF files from scratch by relying on a Web browser. SelectPdfPlus.exe: This program can be used to merge PDFs together or to split them apart. The main purpose of this application is to merge or split PDF files into standalone PDF files or combine them into larger PDF files. In order to create a pdf file using SelectPdfLibrary.exe it is necessary to specify the path to a directory, directory path, file name and/or URL. This information is used to create a new PDF file with the specified file extension. SelectPdfPlus.exe will look at the PDF files that are present in the folder, search for them and merge them into one or many PDF files that can be saved to the folder. You can also use this tool to split a single PDF file into multiple PDFs. Because of the versatility of SelectPdfPlus.exe, this application will be able to process PDF files that have the same location, content, URL and/or name. To save the file, you must enter a path and an optional filename. The application will add the content of all the specified files into a single PDF file. SelectPdfPlus.exe will work in the same way and can be used with existing PDF files and websites. In both the.NET versions of the application, it is also possible to merge or split PDF files directly from within the Visual Studio IDE, using its built-in PDF viewer. You can obtain the URL of the document and the file name from the IDE's references pane.
