Slackware 15.2 & Kernel i686 SMP 05.10.2018 | 263 views Slackware 15.2 & Kernel i686 SMP This version of Slackware is known as "YaST". This project is inspired by the design of Slackware 13.1 and your feedback on Slackware 15.1. Slackware 15.2 It is a "stable" release. The "stable" releases have proven to be more successful in the "real" world. They are "proven" software (not just for hobbyists). There was a goal of cutting number of packages (essentially hardware support). The "non-free" X-based programs (VNC, VirtualBox, etc.) were the first to be cut. Kernel This release of Slackware has a "caret" kernel. The "caret" kernel was a fundamental design change from the "squiggle" kernel. This new "caret" kernel was much more modular and the changes in making the system work were much less disruptive. The drivers were better (no crashes) and there was still room to grow and improve. OpenSSL was used for security (instead of libtomcrypt). I believe "openssl" (provided by the libtomcrypt package) is now the preferred solution for security. The "caret" kernel allowed for module support to be a separate concern and those modules were then loaded based on CPU (or disk) hardware requirements. The current ("caret") kernel is now "louder" (they are configurable). The "louder" kernel is not the default for this release. Instead I have "louder" (and "silent") kernel options that are configurable. The lower volume settings are the default (almost "grumbling"). The higher volume settings are for high traffic (sites running real servers). This is not intended to be a "noisy" kernel, just a "louder" kernel. This is like having a "duck call" phone (as opposed to a "duck call" speaker). This is like
