It is generally assumed that a collimator's primary function is to shape the incident beam into the direction of interest. The irradiation pattern beyond the beam boundaries is rarely considered. The authors compared the distributions of radiation dose, skin dose, and biological effects around the beam boundaries of a 12-MV photon beam using a computed tomography-based model to those computed for beam boundaries fixed at 0.5, 1, and 2 times the minimum collimator dimension. A number of situations were modeled to illustrate various effects of wide and narrow beams. The impact of collimator design on the dose distribution at an infinite plane normal to the beam axis was found to be significant. Special Counsel Robert Mueller's investigation of alleged Russian interference in the 2016 presidential election is reportedly heading toward a "possible obstruction of justice," according to a report from The Washington Post. A senior Justice Department official told the Post that Mueller's team is "aware of potential obstruction" by President Donald Trump and is "looking into" the possibility that he might have committed a crime. The Post noted that it is unclear whether this means that Trump has actually committed a crime and that it appears to be in the earliest stages of a potential prosecution of the president, but there are enough questions surrounding the allegations against Trump that the special counsel's office has been looking into the matter for weeks. Mueller is reportedly investigating an Oct. 7, 2016, exchange in which Trump pushed then-FBI Director James Comey to back off his b7e8fdf5c8
