Toscanaj is a simple tool for browsing conceptual schemas, capable of a very large number of different databases and schemas. The aim is to be an easy-to-use and intuitive tool to understand the concepts of many standards like ISO/IEC 11179, FAST and other related standards. For designing more complicated schemas it is possible to extend Toscanaj to be even more powerful. Toscanaj was created as an open source browser/viewer for conceptual schemas and optimized for a non-technical audience. Toscanaj is a Java-based and user-friendly instrument that comes with additional tools for creating the data displayed and to offer additional and more technical analysis capabilities. The main tools are:

- Toscanaj: The viewer/browser component
- Elba: An editor for conceptual schemas on relational databases. Database-aware and offering extra tools like exporting SQL scripts.
- Siena: In many ways similar to Elba (mostly thanks to shared code), Siena edits conceptual schemas that store their data in memory.

What's New in the Toscanaj?

Toscanaj is a tool designed to visualize conceptual schemas of relational databases. It was created to meet the needs of a large community of people who are not expert in databases nor in particular programming languages. Toscanaj is a Java-based and user-friendly instrument that offers a well-documented API for developers who want to create their own viewers. The viewer was developed around two main concerns:

- flexibility: complex analysis of data is made with just simple operations (like displaying a graph or a table);
- usability: the viewer can be easily used by non-programmer people.

Toscanaj main functions:

- provide a native viewer for conceptual schemas and relational databases (PostgreSQL, MySQL, DB2, Sybase ASE/iAnySQL, SQLite).
- view Oracle tables and views;
- create, manipulate and destroy data (insert, delete, update, and so on);
- create and manipulate relations;
- change relation properties;
- edit relational expressions;
- rename relational expressions;
- convert relational expressions from one schema to another (in this case, one can also load a schema from one database into another);
- format relational expressions (substitute, rearrange);
- build different types of graphs;
- create databases;
