Are you on the fence on who to pick? I guess I'm in the pick for sure camp. I've only done it one other time before. But the playoffs are starting and it's time to get back to those that caused us to lose in the first place. As you can imagine, I spent way too much time on the computer today to get this started early. But I'm always looking to improve. I also went through the pictures I took, edited a few, and put on the Snapchat stories that I created. I know you like that stuff. Overall, I'm happy with how things went. I was pleased with my performance and a little bit more pleased with how the weather cooperated. In most of the pics, I was behind the bench and I think that made a difference. I'm looking forward to my next game. Hit me up on Twitter @JohnnySpin would love to hear from you. Q: Does the RSpec's default `run` include the `example` files? I'm trying to learn RSpec and I don't understand what are the default and proper words for "run" and "example" in RSpec. For example, if I do `$ rspec spec/models/post_spec.rb` does it mean that the example files are run? The first RSpec's tutorial says that "Example files" are the default name for "run". But I can't find any arguments for or against it. Could someone explain this subject? A: In RSpec, the command "example" refers to the files that are the subject of your spec. The default spec file generated by RSpec contains a bunch of examples in addition to the spec file itself. You can see an example of the spec file and its examples in the output from `rspec spec`. You can see where it picks up examples by examining the last few lines of the spec. If the spec file does not contain a "it" method, then the "it" method in the examples will run. You can have a spec that includes different subject files that produce different outputs. If your spec file is called `spec/models/post_spec.rb`, then the `rspec spec` command will run your entire example file and will leave out the example files as specified in the spec file. If your spec file is called `spec/models/post_spec.rb`, then `rspec spec` will run only the examples, and it will leave out the subject file since it's already in the process of running. Note that, although "it" and "subject" are aliases, you can use "it" or "subject" to refer to one or the other. You can see more about RSpec's built in "example" files in the RSpec documentation. A: No, it doesn't mean anything special. `$ rspec spec/models/post_spec.rb` Will run the example group in the file called `post_spec.rb` `$ rspec spec/models/user_spec.rb` Will run the example group in the file called `user_spec.rb` `$ rspec spec/models/post_spec.rb should_delete_user` Will run the example group in the file called `post_spec.rb` The example group is
