Most of the older systems allow basic automation with proprietary application programming interfaces. Autodesk's own API is a simple object-oriented API, but does not offer the programming ability of similar languages like AutoLISP. Its initial name was AutoLISP but was changed to AutoAPI. With the release of AutoCAD 2011, it has been rewritten to run on the Microsoft.NET Framework. AutoLISP is an application programming interface (API) that allows programmers to add object-oriented features to AutoCAD and AutoCAD LT applications. AutoLISP is language-independent and can be used to build custom applications for AutoCAD or AutoCAD LT. The AutoLISP language is the AutoLISP programming language. This language is fully object-oriented and is used for writing macros, functions, and components. AutoLISP is based on the LISP programming language. Like LISP, AutoLISP has dynamic typing, weak typing and automatic garbage collection. AutoAPI is an API for the integration of custom AutoCAD add-on applications. It is a .NET Framework extension of AutoLISP and is language-independent. The AutoAPI library is based on the Microsoft.NET Framework. AutoCAD XML is a technology for expressing object-oriented information as XML that was introduced with AutoCAD 2009. As of 2013 it is deprecated and has been replaced with EDMX. XML is used as a standard data exchange format for creating, updating and querying data from any application. AutoCAD XML (ADXML) is an XML file that stores all of the information relating to a drawing. The XML file is stored in the object-data section. Object data includes any drawings created or manipulated by the user or the application. It is a self-describing format and includes properties describing the drawing, such as line style, label information, and so on. The format of AutoCAD XML is similar to AutoCAD native file format format. This is designed to enable an AutoCAD developer to create custom XML files that are easily integrated into an application or can be imported into AutoCAD. AutoLISP AutoLISP is an application programming interface (API) that allows programmers to add object-oriented features to AutoCAD and AutoCAD LT applications. AutoLISP is language-independent and can be used to build custom applications for AutoCAD or ca3bfb1094

Kevin Kelly, a futurist and tech entrepreneur, has said that he expects self-driving cars to become part of the daily life of the 21st century. Speaking at a conference in London, he said that self-driving cars will be used to go to work and drive children to school. He told delegates at the Masters of the Future conference that he had been writing about autonomous cars for more than a decade and was starting to see the light at the end of the tunnel. "The first wave of autonomous vehicles will be more like personal robots than robot taxis," he said. He said that the first wave will be to get the children to school and the elderly to their doctors appointments. "It's going to be very hard for traditional private car companies to survive in that world because there will be self-driving taxis and self-driving vans and trucks and buses," he said. 'Bizarre animal' He said that a new generation of car makers would have to emerge to survive. He said that he believed that they would be born out of Silicon Valley and a new breed of engineering company. "The idea that this will be a totally new type of company is wrong," he said. "It's going to be the new Volkswagen. In Europe, I believe the new Volkswagen will be a public company. In the US it will be a private company but they will be designed and built in Germany." He
