Play for Bleeding Runner is an interesting and funny running game. You have to run through all levels! No free time! If you have time to waste - forget it! Each second counts! Eliminate obstacles, collect more batteries for your collar, first-aid kit, and stamina tablets, and use the time dilation - and it is not infinite, but if you feel like you have time for more, it will be useful for you!Q: Efficient way to read struct from binary file I need to read a file containing a struct into a buffer, and count the structs' fields. The file has at most 256 fields of a fixed size. One way to do this is to read the file's content into a buffer, and then pass the buffer's data to an algorithm, performing a for loop over the buffer's fields to count the number of fields. But I don't want to read the entire file into memory, because there is a limit on the number of structs in the file. And if there are more structs than 256, that's not going to work. I also need to read from different files, but the same number of fields in each struct. Is there a more efficient way to do this? EDIT I'm trying to use the FindFirstChangeNotification but it requires the system to suspend the thread while it reads the file. This is a huge overhead if the structs in the file have many fields and there is a lot of change. A: No: there is no more efficient way. If there are only a few structs in the file, I would suggest keeping some amount of data in memory. 256 is pretty darn small for the amount of data you need to process. What's new in Townsmen - A Kingdom Rebuilt:

What are the properties of a quantum system that make it impossible to know its state without disturbing it? and what can all these wavefunctions be and why are they described by quantum mechanics? We discuss a particular ansatz for answers, which has been used for many years to describe how atoms and superconducting qubits are detected, and will address another property of a qubit, namely if it are a classical object or not. We then review a current attempt to reconcile quantum mechanics and special relativity. Introduction {#sec:intro} ===== Since Bell's theorem showed that quantum correlations can not be understood in a classical sense, the quest to understand how quantum mechanics arises from general principles beyond the knowledge of individual properties of a system was the major focus of research. But from the outset there were uncomfortable gaps, missing interconnections. That there are only three (or perhaps more) independent fundamental interactions in nature and spin 1/2 fermions don't exist is a hard statement, and likely not correct, but if one takes it as the nature of quantum mechanics one enters a world of results which is not in harmony with our experience. We may have to accept that quantum mechanics is something fundamentally new. There are efforts to define quantum physics in the continuum, without Lorentz invariance. Cosmologists have often put forward such considerations. One could even imagine a logic framework where the long time scale properties of matter originate in dark energy, and only diverge at Planck scales to conform with the properties of quantum mechanics, etc. But should one accept that quantum theory is the ultimate theory of reality? It feels as if so. There are arguments for a Bekenstein type of bound (we essentially know the order of the solar mass, at least in the center of galaxies - see Csiki et al [CsEtz15]) while leaving open a Bekenstein relation (or at least a bound) of the type: $\hbar S \leq \text{entropy}$. In this essay, we will try and find a relationship between one such form of quantum numbers and thermodynamics.
