iOS, Android. You can also adjust the settings to get real-time notifications for any changes to your.Q: Laravel:

How to enable all possible observers? It's a Laravel 5.4 site and I was about to enable all

possible observers in the event that one of my clients was interested in seeing what I am up to. So, I've found the event that Laravel provides for this.

```
\Event::listen('view.my_profile',  
function() { // my_profile is the  
class name }); \Event::listen('vi  
ew.my_chatroom', function() {  
    // my_chatroom is the class  
    name });
```

```
\Event::listen('view.upload',  
function() { // my_upload is the  
class name });
```

```
\Event::listen('view.download',  
function() { // my_download is  
the class name }); And as you  
can see it's simply a nested
```

listen function so that I get the observers of each event I create. So, my question is, is there a way I can do this without writing a function for each class? A: The event is called via a listener instance, this would allow you to run through all its listeners until you find your class and then call the hook

```
$class = new ReflectionClass('WhateverClass');  
$listeners = $class->getListeners('view');  
foreach($listeners as $
```

Added value to business: • Centralize, secure and manage your files from multiple locations. (Photo: Andre Ives, ZDNet) . Share a web-accessible link anywhere you want. . Get Free Cloud Storage Now! All you have to do is sign in to your Google account (it is unlikely that you don't have one), download the.1. Field of the Invention The present invention relates to the storage of information with a plurality of network storage device arrangements, and more particularly, to the storage and access of network storage devices from heterogeneous clients. 2. Background of the Invention A storage system generally includes at least one processor operably coupled to a storage device, such as a disk drive, optical drive, and/or other storage element. In these systems, a host can transfer input data to the storage device where it can later be retrieved. The storage device can be coupled to one or more additional storage systems. The storage device can also be coupled to at least one server (sometimes referred to as a "server"), which may be a system for operating on data with a processor. The storage device, server, and/or host can be operably coupled to a network, such as a local area network (LAN) or a wide area network (WAN). In many environments, a plurality of storage systems can be coupled to at least one server via the network. The servers can be used to act on, or otherwise operate on, data that is stored on the various storage devices. In some cases, data and/or metadata can be moved from one storage device to another. A server can also be used to generate certain content that is then served to one or more of the plurality of storage devices. Other servers can be used to distribute data that is stored on the storage devices to clients. The storage devices may be coupled to a fabric that permits multiple servers to access the storage devices. In this context, the storage devices and servers may be referred to as logically "movable storage." Various approaches have been used to effectuate such data storage and access. For example, a client may be configured to access a server, and the server may be operably configured to access a particular storage device. Alternatively, servers and storage devices may be configured to directly

access other servers and storage devices. For example, a server may be configured to directly access a data source. Accordingly, it can be seen that a significant amount of processing
