Q: When using varchar(max) is it better to create a table or table variable? Is there a difference in performance when creating a varchar(max) field in a table versus creating a table variable and inserting that into the table? A: For varchar(max) it is almost the same as varchar(1000). The only difference is, if you insert 4000 characters then the varchar(max) is limited to 4000 chars. The table variable is limited to the database server buffer size and does not contain any data (you have to provide the data yourself). CREATE TABLE #MyVar (MyVar VARCHAR(MAX)) INSERT INTO #MyVar (MyVar) VALUES('abcdefghijklmnopqrstuvwxyz') The table variable uses the buffer_size (usually 1MB) of the server where the variable is created. In SQL Server

2012 you have to declare the variable before you insert the data, but before the declaration the variable cannot be used. In earlier versions it worked the other way around. CREATE TABLE #MyVar (MyVar VARCHAR(MAX)) DECLARE @MyVar VARCHAR(MAX) INSERT INTO #MyVar (MyVar) VALUES('abcdefghijklmnopqrstuvwxyz') SELECT @MyVar DROP TABLE #MyVar A: As far as I know there is no difference between them for varchar(max). Also it does not matter what type it is. But sometimes you may have to check that the total length of string is less than a variable. For example. declare @var varchar(max) declare @max length select @max = max(length(@var)) from sys.databases where database_id = DB_ID() select @var + @max in some cases you have to make use of table variable.
