The present invention relates to an ink ribbons used to form print, such as letters, figures, symbols, and others, and more particularly to an ink ribbon having a solution containing a coloring material which is capable of evaporating in a supercritical state and a process for producing the same. In general, print can

be formed on a paper by applying a print image to the paper with a print head by depositing ink, such as a solution, containing a coloring material. The print head has an ink chamber in which the ink is stored and a nozzle communicating with the ink chamber. As the print head is driven, the ink is supplied into the ink chamber through the nozzle and is pushed to the paper

to form a print image. For forming a color print image, an ink jet printer forms a color image by depositing a plurality of kinds of ink of different colors, such as black, blue, cyan, magenta and yellow, onto the paper. These kinds of inks are usually produced by mixing a coloring material and a liquid (organic solvent, water, solvent) in an

appropriate ratio. In some cases, the ink may be produced by dissolving the coloring material in a liquid. However, when the dissolved coloring material in the solution is deposited onto the paper, the dissolved coloring material does not deposit on the paper in a perfectly layered state. This results in having a problem that the dot diameter of the ink image

printed on the paper differs from the desired diameter.

Japanese Switch The Japanese Switch (JSW) is a family of technologies used by Sony and other companies in the Japanese video game market. The JSW family of technologies are described as decoders,

decoders and compression, and a game console can include several of these technologies, such as AVI (Video Interactive Disc) video, CD-i (Compact Disc Interactive) interactive audio, and as PlayStation (PlayStation's primary technology), PlayStation 2, PlayStation 2 Power Model, PlayStation 3, PlayStation 4 and PlayStation VR

(PlayStation VR is a virtual reality solution designed for use with the PlayStation 4 console and PlayStation 4 Pro consoles). The JSW technologies were introduced to the Japanese video game market in the early 1990s. In 1995, Sony introduced the CD-ROM2 standard, which replaced the previous CD-ROM standard. This caused many video game publishers to

worry that Sony would eventually change the hardware on which video games were played, which Sony denied. In order to avoid a hardware change, Sony created the JSW technologies. The Super System 64 video games, which used the Super System hardware, are the only games that are playable on a PlayStation (PlayStation 2, PlayStation

3, PlayStation 4) running in PS3 Mode. JSW

Background Sony, MSX and NEC were the pioneers of the console market.

Sony's first video game console, the Sony DSN-1, was announced in 1980 and released in 1981. By the early 1990s, the Super NES, the Sega Genesis, the Nintendo Entertainment System, and the Game Gear were already

established. Sony had an advantage because it had experience in both music and video game development, but many people believed that Sony would soon upgrade the PlayStation's hardware. Sony built two new systems to get ahead of the competition, the Japanese Mega Drive/Genesis (Mega Drive), and the Japanese SNES (Super Famicom).

Sony wanted to maintain a system that was technologically superior to the competition, and as a result, it built the Mega Drive to run third-generation games developed for the SNES, and vice versa. The Mega Drive introduced the 16-bit Sega Genesis (Mega CD, 32X and Sega CD), and the SNES introduced the 16-bit Super Nintendo (Super

Famicom). History During the first half of the 1990s, the Sony PlayStation was the leader in the video game console market. Sony introduced several
