Field of the Invention The present invention relates to a semiconductor memory device and, more particularly, to an improvement in the structure of a word line driver for driving a word line. 2. Description of the Related Art A SRAM (Static RAM) memory device, as one of semiconductor memory devices, has a memory cell array consisting of a matrix of memory cells arranged in a direction in which bit lines extend and a direction in which word lines extend. A word line decoder is provided on one side of the memory cell array. In such a SRAM memory device, the word line driver is generally driven by an external power source. In order to increase the number of memory cells and to improve the integration degree, there is a tendency for a device to be miniaturized. However, as the device is miniaturized, a level difference between an n-type diffusion layer formed under a transistor and a substrate rises, which causes the withstand voltage of a device to lower, making it difficult to prevent the latch-up phenomenon. In order to deal with the latch-up phenomenon, it is necessary to apply a voltage to a word line of the memory cell array which is greater than a threshold voltage. However, if a word line driver for driving a word line is provided externally, a drive voltage applied to the word line driver inevitably becomes high. Japanese Patent Laid-Open Publication No. Sho 63-32813 discloses a technology for preventing the generation of the latch-up phenomenon by applying a voltage to a word line of a memory cell array which is lower than a threshold voltage. The Publication discloses a technology for applying a voltage by utilizing a resistor element. In order to apply a voltage to a word line of the memory cell array which is lower than a threshold voltage, however, a current I1 flow, to the word line of the memory cell array when the level of an output from a decoder for the memory cell array fluctuates from an "H" level to an "L" level. As a result, a voltage is applied e79caf774b

As a bonus, here are several links that I have gathered. It would be good if this is useful for some one else: A: Check the "Global register content" tab on the Properties dialog for the offending DLL and see if the Name, Source, and Destination box show "Unknown" in the location column. Do the same for each of the reference DLLs that is using the offending DLL. That was the key to it. The "Unknown" value causes Symantec not to produce a checksum on the DLL.

Trump's the doormat: Hillary Clinton's 'do nothing' Army of bureaucrats, lawyers and Ivy League professors gets what it deserves. By Henry Payne There's a strange new phenomenon happening in Washington. Thanks to House Republicans and their refusal to act on a D.C. Circuit Court ruling requiring the reinstatement of DACA, the United States Immigration and Customs Enforcement agency, "Otherwise known as Donald Trump's army of bureaucrats, lawyers and Ivy League professors who have gotten what they deserve," as Charles Schumer put it, is disappearing. What's going to happen to the estimated 1.8 million DACA recipients? They'll be deported by the 40 percent of that number who aren't U.S. citizens, but the bottom line is the only purpose these people serve is to get in the way of the battle over Trump's wall.

What about the issue of DACA recipients having strong U.S. citizen children? Tough luck, that's what I call "Trump's doormat," a political, well-connected group that gets what it deserves: The Trump administration also reportedly is
