When do we care about $e^{-x} = 1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \dots$? I am not sure if this question belongs here. If it is not acceptable to ask such a question then I would appreciate it if you could point me to an appropriate place. (Please do not give answers in "a related" manner but try to explain what is wrong with "related" questions.) A: As ycw already indicated the answer is e^{-x} when $x \rightarrow \infty$. On the other hand,
$$e^{-x} = \sum_{n=0}^{\infty} \frac{(-1)^n}{n!} x^n \\ = 1 + \frac{x}{1!} - \frac{x^2}{2!} + \frac{x^3}{3!} - \frac{x^4}{4!} + \dots \\ = 1 - x + \frac{x^2}{2} - \frac{x^3}{6} + \frac{x^4}{24} - \frac{x^5}{120} + \dots$$

As the game is under constant development, we hope to work towards rectifying this situation in the future.
