The main restriction of .NET's managed code is that it can only be executed on a .NET Framework 2.0 or later PC. While .NET can use code from any platform, it has a set of limitations. .NET can not use functionality that a system does not provide. You can not, for example, write an application using XNA, which requires full-blown DirectX to run. Very large amounts of memory can also be an issue. .NET can use up to 2Gb of memory on 64-bit operating systems. Many programs create large objects that can easily eat up all of your memory. As an example of the 32-bit vs 64-bit difference, let's take the 32-bit version of Internet Explorer. The 32-bit version can use a maximum of 2Gb of memory, while the 64-bit version can use up to 64Gb of memory. .NET is a very complex and powerful technology. However, the basic concepts are the same. The Internet Explorer browser uses an API to access the Internet. This API is called the Document Object Model. Microsoft provides the .NET Framework with an extensive Document Object Model that enables programs to access the Internet. The Document Object Model is a database of HTML documents that are available on the Internet. The DOM is implemented as an API and consists of objects that represent the HTML documents. An object in the DOM is called an element. Each element can have attributes and child elements. Attributes are properties of an element that describe it. An element can have one or more child elements. Each child element is a node in the DOM. Each node can have text and other child nodes. The node can have attributes and other nodes as children. It is possible to traverse all of the nodes in the DOM using the DOM API. Every node can have a parent, children and attributes. The parent node is the node that contains all of the other nodes in the DOM. There is no limit to the number of nodes that can exist in the DOM, but the nodes cannot have circular relationships. It is also possible to access the data that is contained inside the nodes. Each node has a set of name-value pairs for its attributes. Each name has a defined character set for the case-insensitive name. The defined name-value pairs can be accessed as an array. You can use any name-value pair for any node. You can access the values of an attribute by using the []

The Rayport Clan are the origin of the Northfield Outlaws and they are a clan of ruthless warriors who wield the power of the elements. Ben Jones was hired by the Rayport Clan as a bodyguard and after a night of partying he was unable to join them in their fight against the rival Haggis Clan. Now they intend to use him against his former employer, even if it means following a dangerous mission to Mount Emily. He then wanders into the near future, where he meets Sadie Jones, a scientist whose research shows that with the right climate and assistance, humans and animals can coexist. Upon meeting him, she informs him that if he can successfully bring back the planet's extinct animal species and allows them to live in peace on Earth, she will gladly help him save his past life. They then embark on a journey to save the dinosaurs, guided by sound of their trumpeting song.
