hedgehog running on the live cd? The following are the best computer
games of all time. video memerat 2 1.90 free download1. Field of the
Invention The present invention relates to a network system, a
network program, a network method, and a computer readable
medium storing the network program. 2. Description of the Related
Art A content-based network system (hereinafter also referred to
simply as “network system”) that generates a program to be
distributed is typically configured to include a server apparatus which
stores an applet file which includes the program to be distributed, a
receiving apparatus which accepts the applet file and downloads the
program to be distributed, and a client apparatus which reads the
downloaded program from the receiving apparatus and starts the
applet program. The applet file includes a Java™ applet file
(hereinafter also simply referred to as “applet”) in which a script
which controls the operation of an applet and a Java™ virtual machine
(hereinafter also referred to simply as “VM”) program corresponding
to a script are stored. The applet is a kind of a computer application
program that is downloaded from a server apparatus and starts up on
a client apparatus in accordance with a user operation. A VM
program, a script included in the applet file, and the like are called,
for example, a Java™ class file and bytecode respectively. The applet
and the VM program include static data and a control logic, and are
obtained by compiling a class that includes the static data and the

control logic. An example of content distribution in a conventional network system will be described in brief below. In the conventional network system, a server apparatus and a client apparatus connect to each other via a network and exchange an applet file when a user terminal apparatus provided in the client apparatus requests distribution of the applet file to the server apparatus. After the user terminal apparatus requests the distribution of the applet file, the server apparatus stores the applet file in a cache memory included in the server apparatus and downloads the applet file to the user terminal apparatus when the user terminal apparatus re-requests the applet file from the server apparatus. To distribute and request an applet file
