Pdf Free 114A wedding day is a
momentous occasion — like, you know,
its own big blue dot. And as you've
undoubtedly heard, that big blue dot is
the topic of today's Geek Out item —
the quantum suicide thread. The timing
of today's article, which includes
roughly 20 pages of unintelligible
double-speak, is fascinatingly symbolic:
it falls on the first day of winter. On a
very weird day, to be precise. The first
day of winter that's in the middle of the
day. And it's cold. Because astronomers
have a serious habit of thinking up new

ways of measuring "centuries" instead of "decades" or whatever, they now have an official definition of a "century" — and it's rather ingenious: The average age of the universe, within a certain statistical margin of error, is estimated to be somewhere between 13.8 and 13.9 billion years old, with 13.85 billion years the current accepted value, and 13.91 billion years the oldest value ever confirmed (Observations of the Wilkinson Microwave Anisotropy Probe). Taking advantage of this approximate consensus of scientists in the field of astrobiology, astropaleontology, and cosmochemistry, the editors and scientists of the Journal of Cosmology have defined a new method of quantifying the duration of the universe

as 1.0 century. Okay, so that sounds simple enough: a century is equivalent to, let's say, eight billion seconds or eight billion years. A bit like the eight-hour rule, except for time and instead of hours. But as you know, as we know, that doesn't really answer the most important question of all: How long has the universe been going on? No, no. This isn't one of those questions. Photo by Patricio Guzmán in the Creative Commons. It is yours. See, you might reasonably be thinking that, yes, any time you can figure out a definition of a century — or a decade, or a year, or any other arbitrary unit of time — you might as well go ahead and actually answer that most important question. And you're pretty sure that's where you're going. And you might be right. N
