What To Wear For Your First Date
septiembre 11, 2016
The groundbreaking study of animal migration in the Middle East conducted by a German-American team is still very much under the spotlight in the media, due to the fact that numerous media outlets are currently promoting the study as if it has been validated by the scientific community. This is not the case; it has not been released in full in a peer-reviewed journal yet. The study itself is flawed from the outset, because the sampling methods used are not valid. The authors claim to have selected “key times of migration” in the region, based on the assumption that the direction of migration in the morning does not differ from the migratory direction at night. This assumption is not valid, since the winds in the desert in the middle of the day are erratic. When the authors compared the migration of different species in Saudi Arabia in the morning and in the evening, they reported the same direction for birds (southward) but different results for the night and day birds of other species, which migrated southward in both cases. The direction of migration in a given species in the Middle East can thus not be considered as a true representation of the migratory habits of that species in the region. To date, there has been no global or long-term study on animal migration. (A study of the migration of plants had already been carried out at a global level, but this was restricted to the area north of latitude 30°N, i.e. excluding the Mediterranean region.) The only global studies on animal migration (mammals, birds and reptiles) that have been conducted so far, include studies by the National Oceanic and Atmospheric Administration (NOAA) on the migration of sea birds. This study, which was carried out in the mid-1980s, showed that most sea birds (e.g. birds from the North Atlantic Ocean and the Pacific Ocean) reach their breeding grounds after travelling south along the coast of Africa and then north along the West African coast. One large species of migratory bird (the so-called “Goliath Gull”) migrates in the opposite direction: it takes off north of Europe and flies all the way to the Pacific Ocean before continuing on its way to Australia. The German and American research team, however, decided to carry out a “one-off” study, which thus ignores all the available information on animal migration worldwide. This is not a scientifically valid approach. In
