It is particularly of interest in this field of technology to produce thin-walled cylindrical tubing, tubes, shafts, round or other types of articles, or other thin-walled articles having a high strength-to-weight ratio, as well as thin-walled articles having complex shapes. In prior art methods, multiple techniques are required to produce a thin-walled article having a desired strength and toughness, and it often is difficult to produce a thin-walled article having desired strength and toughness properties. One prior art method of manufacturing thin-walled articles includes forming an article by cold rolling, then subjecting the cold-rolled article to a heat treatment to achieve the desired mechanical properties, and then hot-rolling the heat-treated article to form the article. In this method, the loss of the metallic yield stress and the ductility properties of the rolled article during the heat treatment is substantial, and a non-uniform distribution of the properties occurs in the article. As such, this method is quite limited as to the structural properties that can be imparted to the article. Another prior art method of manufacturing thin-walled articles includes forming an article by hot-working the steel in a forging die, then further hot-working the hot-worked article by a rolling operation. In this method, in some cases, the hot-worked article is subjected to a cool-down operation and a secondary hot-rolling operation. The final workpiece produced by this method is, however, difficult to finish and to form in complex shapes such as an internal rib, or in other shapes which result
