In late 2014, Fujifilm released its mirrorless X-Pro2 camera. After a heated battle with the camera giant, the D4 was withdrawn in April 2015 in favor of the X-Pro2. Panasonic and Olympus are planning to follow suit with their in-house mirrorless camera offerings, but I feel that the Fujifilm X-Pro2 is the best-equipped camera for beginners. With a slightly bigger sensor, good auto-iris, and stronger control through buttons, this camera is geared toward professionals.

It was only a matter of time before I got to put this camera to the test. I've been a Fujifilm fan for many years (I'm still rocking my first TLR, and since it quit accepting firmware updates, it's likely to remain my base camera for many years to come). And over the years, I've been learning to use the Fuji X-system, as technically savvy as it may be. The thing is that Cinema4D is more a modeling software, while Maxon CINEMA 4D is more a piece of paint app for 3D. If you're following the Maxon's tutorial and have that 3D software, you might want to stick to it. But, if you're going to work with a different software, you might want to read down this site, because we'll be talking about CINEMA. Adobe is a company we all work with.
